AMENDMENTS TO THE CLAIMS

This listing of claims replaces all prior listing of claims in this application.

Claims 1-12 (canceled).

13. (currently amended) A method of fabricating a semiconductor device, the method comprising:

depositing a dielectric film over an active region of a semiconductor substrate to form part of a gate of a transistor; and

subjecting the dielectric film to a densifying treatment to stabilize said film by heating the semiconductor substrate; and

subjecting the <u>said stabilized</u> dielectric film to a wet oxidation with steam process <u>in a rapid thermal process chamber</u> to raise the oxygen content of said <u>stabilized</u> dielectric film provided by heating a mixture of hydrogen and oxygen gases <u>in a rapid thermal process chamber</u> at a temperature greater than about 450 °C, wherein <u>said dielectric film undergoes wet oxidation with only a mixture of hydrogen and oxygen gases that form steam, and wherein the ratio of hydrogen to oxygen gases is in the range from 0.1 to about 0.8 <u>and the pressure of said rapid thermal process chamber is held at about atmospheric pressure</u>.</u>

14. (previously presented) The method of claim 13 wherein the wet oxidation process is performed at a temperature in the range of about 750 °C to about 950 °C and for a duration of about 20 seconds to about 60 seconds.

Claim 15 (canceled).

Application No.: 09/912,558 Docket No.: M4065.0319/P319-A

16. (original) The method of claim 13 wherein depositing a dielectric film includes depositing a material having a dielectric constant of at least about 25.

17. (original) The method of claim 13 wherein depositing a dielectric film includes depositing a material selected from the group consisting of tantalum oxide and silicon nitride.

Claims 18-41 (canceled).

42. (currently amended) A method of fabricating a semiconductor device, the method comprising:

depositing a dielectric film over a semiconductor substrate to form one of a gate and a capacitor dielectric; and

subjecting the dielectric film to a wet oxidation with steam process to raise the oxygen content of said dielectric film provided by heating a mixture of only hydrogen and oxygen gases in a rapid thermal process chamber at a temperature greater than about 450°C, wherein said mixture is a ratio from 0.1 to approximately 0.80 of hydrogen gas to oxygen gas for a period of about 20 to about 60 seconds and said hydrogen and oxygen gases are combined in said rapid thermal process chamber and said rapid thermal process chamber has a pressure of around 1 millitorr.

Claim 43 (canceled).
